Male 70 Standard	\$2,165	\$4,330	\$6,729	\$6,495

The findings of a major study determined that the average time on a long term care insurance claim is 4 1/4 years.

Of the 400,000 claims analyzed, 95% of all claims were for under \$200,000 of dollars paid. This means there was only a 5% chance a claim would be over \$200,000. Most of these people were in their 80s when on claim.

Taking into consideration inflation and medical technology, to cover 95%, a 60 year old should have a pool of dollars valuing \$400,000 should a claim begin at age 80. That increases to \$475,000 if the claim were to begin at age 85.

A 65 year old should have \$475,000 in their available pool by age 80 and \$500,000 by age 85.

These are per person and it is suggested that at minimum of four to five year benefit period should be taken into consideration.

There are also options where life insurance can be used to help pay for long term care expenses.
